## DETAILED ACTION

### *Election/Restrictions*

1. Applicant's election of Species A, high silica pentasil zeolite, in the reply filed on April 20, 2004 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).
2. Claims 6-13 are withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected species, there being no allowable generic or linking claim. Election was made **without** traverse in the reply filed on April 20, 2004.

### *Claim Rejections - 35 USC § 103*

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-5 and 14-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Monque et al.

Monque et al. (US 5,576,256) discloses a catalyst composition useful in hydrocarbon conversion processes. The catalyst composition comprises a high silica MFI zeolite, such as ZSM-5, in combination with a binder (column 2, lines 60-68 and column 3, lines 30-50). The examples detail the use of ZSM-5 in hydrogen form. The reference teaches that the formed catalyst is preferably calcined in two stages; in the

Art Unit: 1725

first stage is carried out between about 120 degrees C to about 350 degrees C for about 1-6 hours, and the second stage is carried out between about 350 degrees C to about 700 degrees C for about 1-6 hours, which meet the ranges instantly claimed (column 5, lines 10-17). The reference teaches that the catalyst is employed at a temperature of 250-450 degrees C (column 5, lines 30-45), which is considered to meet cooling step (c).

The difference between the reference and the claims is that the reference does not disclose specifically that the second temperature is at least 100 degrees C greater than said first temperature. However, the reference discloses a range of temperatures for the second step which would result in a 100 degree C temperature differential. Thus the ranges disclose by the reference overlap the ranges instantly claimed. With respect to the encompassing and overlapping ranges previously discussed, the subject matter as a whole would have been obvious to one of ordinary skill in the art at the time of invention to select the portion of the prior art's range which is within the range of the applicants' claims because it has been held prima facie case of obviousness to select a value in a known range by optimization for the results. *In re Boesch*, 205 USPQ 215. Additionally, the subject matter as a whole would have been obvious to one of ordinary skill in the art at the time invention was made to have selected the overlapping portion of the range disclosed by the reference because overlapping ranges have been held to be a prima facie case of obviousness. *In re Malagari*, 182 USPQ.

**Conclusion**

5. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
